

Controlling your Comfort Room by Room

# Zone Plenum Sensor Model ZPS

The Zoning Plenum Sensor, Model ZPS, is a duct mounted sensor used with the ZONEFIRST MasterZone™ Control Panels. The ZPS senses the supply air plenum temperature and protects the furnace, compressor or heat pump from over temperatures as zone dampers close down and air flow may be restricted and especially when a by-pass is used and supply is mixed back into the return air which can cause extreme plenum temperatures. The ZPS protects the equipment by cutting off the heating or cooling call when its limit temperature is reached for either heating or cooling.

The ZPS insures the heating and cooling equipment is protected when zoning.

The ZPS senses the supply air temperature and the actual control is on the zoning panel. The zoning panel has an adjustable heating set point from 100°F to 170°F and a fixed cooling set point at 45°F, for the ZPS. When the supply air temperature rises above the heating set point or below the cooling set point, the zoning panel will lockout the heating or cooling equipment. The calls are maintained and conditioned air is still delivered to the zones. The ZPS must sense a 10°F drop in the supply air temperature before bringing the heating back on after tripping. In Cooling, the supply air must raise to 55°F before allowing the compressor to come back on. The 10°F reset temperature allows an adequate off time in order to prevent compressor/equipment short cycling.

The ZPS inserts into the supply air duct, see location information and drawing on right, and requires only two (2) wires to the zoning panel. Lengths longer than 15 feet or that come in close contact with line voltage, shielded cable is recommended.

## INSTALLATION

Choose a location for the ZPS in the supply air duct downstream of the heat exchanger and cooling evaporator coil, and before the by-pass and any zone dampers. It is also recommended to not be directly in line of sight with the heat exchanger or cooling evaporator coil, if possible.

For Heat Pumps it is recommended to be located in the air handler downstream of the evaporator coil and before the strip heaters.

To Install:

1. Drill a 1/2" hole in the duct where the ZPS is to be mounted.
2. Insert the ZPS into the hole opening and insure the probe extends beyond any insulation.
3. Secure to the duct with self-tapping screws, provided.
4. Wire to the zoning panel.

This chart is used to determine the temperature sensed by the ZPS probe. Match the resistance reading to the temperature.

Temperature °F	Resistance	Temperature °F	Resistance
